Patient Flow RTLS
How It Works in Same-Day Cancer Treatment Facilities

Litum

Check-in and Registration

Patients are greeted and checked in manually or via self-service kiosks, capturing essential information and confirming treatment details. Patient Flow RTLS enables front desk staff to monitor wait times and coordinate arrivals with available rooms, minimizing delays at the start of visits.

Initial Assessment

A nurse or care coordinator assesses the patient, checks vitals, and reviews recent symptoms or side effects. Litum's solution ensures rooms or bays are ready as soon as registration is complete, reducing idle time for patients and caregivers.

Medical Evaluation by an Oncologist or Specialist

An oncologist or specialist may review the patient's condition and discuss treatment adjustments as needed. Patient Flow RTLS enables physicians to see which patients are ready for evaluation, streamlining workflow and minimizing back-and-forth between rooms.

Lab Testing

Some patients may need blood tests or other diagnostics to confirm treatment readiness. Litum's patient flow data helps lab technicians and nursing staff coordinate these tests efficiently, minimizing patient wait times for lab results before treatment.

Preparation for Treatment

Once cleared, the patient is guided to a treatment area, with Patient Flow RTLS ensuring rooms are prepped and patients are escorted promptly to minimize waiting, maintain comfort, and keep treatment on schedule.

Treatment Administration

During treatments like chemotherapy or immunotherapy, patients may need close monitoring for reactions or side effects. Litum's software allows caregivers to track patient location and status in real time, enabling swift responses and timely checks throughout the session.

Reevaluation and Post-Treatment

After treatment, a caregiver assesses the patient's response and provides care as needed. Patient flow visibility enables caregivers to monitor progress and respond to any adverse reactions, ensuring patient safety and comfort before discharge.

Consultation with Specialist or Support Services

Patients may meet with support services like nutritionists, counselors, or palliative care specialists to discuss post-treatment care. Patient Flow RTLS streamlines these interactions by coordinating schedules, reducing wait times, and enhancing the patient experience.

Discharge Planning and Follow-up

Upon discharge, patients receive at-home care instructions, prescriptions, and follow-up appointments. The Patient Flow solution tracks discharge readiness, ensuring a smooth transition from treatment to check-out without delays.

Check-out and Scheduling of Next Appointment

Before leaving, patients can schedule their next visit, often with front desk coordination. Patient flow data expedites check-out, minimizing delays and allowing patients to focus on recovery.
