

CASE STUDY

Connected Oversight for Long-Term Care  
How Litum Strengthened  
Wander Management and  
Asset Visibility at AC Restmor

## Key Challenge

Apostolic Christian Restmor (AC Restmor), a long-term care and skilled nursing facility in Illinois, USA, needed a more advanced approach to wander management and asset visibility across its facility. Their existing wander management system lacked real-time visibility into resident movements and asset locations, limiting staff awareness and making it difficult to proactively monitor activity across the facility. They also wanted better visibility into the location of critical mobile equipment used throughout daily operations.

## Solution

Litum deployed an RTLS solution combining Wander Management and Asset Tracking across the facility. Residents were equipped with wearable tags to support location tracking and automated access control scenarios. Integrated with the facility's access control infrastructure, the system helped prevent unauthorized exits through external doors. Asset tags provided staff with immediate visibility into the location of critical mobile equipment throughout the facility.

## Features

**Real-Time Location Tracking:** Continuous visibility into resident and asset locations across the grounds

**Zone Entry and Exit Alerts:** Alerts generated when tagged residents approach or move through designated areas

**Automated Door Control:** External doors automatically managed based on predefined safety rules

**Access Control Integration:** Integration between AC Restmor's existing access control infrastructure to support centralized visibility and wander management

**Tamper Alerts:** Notifications generated if resident or asset tags are removed or interfered with

**Out of Sight Alerts:** Monitoring of resident movement, including out-of-sight alerts, to reduce wandering risks

**Low Battery Alerts for Tags:** Automated alerts indicating low battery levels to ensure continuous operation and reduce monitoring gaps

**Historical Incident Data:** Logged activity available for compliance reviews and incident pattern analysis

## Results

AC Restmor staff gained continuous visibility into resident and asset locations through Litum's centralized system, reducing reliance on manual monitoring and improving awareness of movement throughout the facility. The system also delivered a more streamlined user experience compared to the facility's previous setup, based on early on-site feedback following deployment.

Litum's deployment established a scalable foundation as the facility looks to expand tracking capabilities and evolve its use of RTLS over time.
